

Virtual Agent-Driven SLA Breach Awareness & Justification System

Date	XXXXXX
Team ID	XXXXXX
Project Name	Virtual Agent-Driven SLA Breach Awareness & Justification System

Scalability & Future Plan

This document outlines how the Virtual Agent-Driven SLA Breach Awareness & Justification System can be scaled to handle larger user bases and extended features in the future, while capturing the roadmap for evolving the project beyond its current 90% completion state.

Current System Limitations

S.No	Limitation	Impact	Priority
1	Restricted to Incident Table	Governance is currently limited to Resolution SLAs on incidents only.	High ▾
2	Fixed 80% Threshold	Notifications only trigger at a hardcoded business elapsed percentage.	Medium ▾
3	Role-Based Access	The Virtual Agent topic is currently restricted to users with the 'itil' role.	Medium ▾
4	Manual Acknowledgement	Requires manual user input through the Virtual Agent to update risk flags.	Low ▾

Scalability Plan

S.No	Scalability Aspect	Current State	Proposed Upgrade
1	User Load	Currently optimized for internal 'itil' users.	Expand access to all employees via the Employee Center portal.
2	Data Storage	Justifications stored as string fields in the Incident table.	Implement historical archival for SLA breach data to maintain performance.
3	Performance	Flows run for specific SLA definitions (Incident Resolution).	Transition to background processing for high-volume notification triggers.
4	Security	Access controlled via UI Policy and basic role requirements.	Implement granular ACLs for sensitive breach justification data.

Future Roadmap

Phase	Planned Feature / Enhancement	Target Timeline	Expected Impact
Phase 2	Multi-Channel Integration	Q4 2026	Notifications via MS Teams and Slack for faster assignee response.
Phase 3	Cross-Module Governance	Q1 2027	Extend SLA justification system to Change and Request Management.
Phase 4	Predictive AI Analytics	Q2 2027	Use AI to predict breaches based on historical justification and reason data.
